CEWELD E DUR 71

ТҮРЕ	Basic coated electrode with a sintered tungsten carbide core wire.					
APPLICATIONS	For extreme wear resistance, elements as Niobium and Chromium carbides are also added to obtain a complex carbide structure. Specially used for applications subject to abrasive wear such as sand or other minerals with little impact. Recommended for the brick and clay industry or extreme high temperature applications in power plant industries.					
PROPRIÉTÉS	CEWELD E DUR 71 is designed to offer full wear resistance and high hardness already achieved in the first layer. To be welded with low as possible current to avoid burnout of elements.					
CLASSIFICATION						
CONVIENT POUR	For extreme heavy abrasion and wear applications such as, mixers and screws in the brick and clay industry, electricity powerplant srews (ash), mining, drilling etc					
AGRÉMENTS						
POSITIONS DE SOUDAGE
